This article describes how to restore files backed up by Autobackup-Pro. It assumes you are using the full registered version with the 'Keep Files in Original Paths' checkbox ticked.

## Step 1 – Find Location of the Backup Folder

Start Autobackup-Pro from your Start Menu > Program Files > Acute Software > Autobackup, and click 'Manual' to start the program in manual mode. Note the backup location (default is C:\Backup) – Select and copy this location using <CTRL> <C>

## Step 2 – Open this Folder with Windows Explorer

Go to your Start Menu and select Run.

Then paste in the backup folder <CTRL> <V> and press enter

You should see your list of backed up files in the similar folder structure.

## Step 3 – Copy the files back to the Original Locations

Open up a second explorer window so you can see both folders at once – this makes it easier to see which files are missing.

You can drag back individual files, and multiple ones, but be careful of the dates of the files – for example if you have modified a file today and the backup ran last night, you will not want to restore the old copy or you will lose a days work.
